1. POINTS AWARDED FOR PRICE

A maximum of 80 points is allocated for price on the following basis:

80/20

$$Ps = 80 \left(1 + \frac{Pt - Pmax}{Pmax} \right)$$

Where

7. POINTS AWARDED FOR SPECIFIC GOALS

1. In terms of Regulation 4(2); 5(2); 6(2) and 7(2) of the Preferential Procurement Regulations, preference points must be awarded for specific goals stated in the tender. For the purposes of this tender the tenderer will be allocated points based on the goals stated in table 1 below as may be supported by proof/ documentation stated in the conditions of this tender:
2. In cases where organs of state intend to use Regulation 3(2) of the Regulations, which states that, if it is unclear whether the 80/20 or 90/10 preference point system applies, an organ of state must, in the tender documents, stipulate in the case of—
 1. an invitation for tender for income-generating contracts, that either the 80/20 or 90/10 preference point system will apply and that the highest acceptable tender will be used to determine the applicable preference point system; or
 2. any other invitation for tender, that either the 80/20 or 90/10 preference point system will apply and that the lowest acceptable tender will be used to determine the applicable preference point system, then the organ of state must indicate the points allocated for specific goals for both the 90/10 and 80/20 preference point system.

EXECUTIVE SUMMARY

Boiler Auxiliary Cooling Heat exchanger refurbishment contract for a period of 5 years at Duvha Power station. The scope of work include stripping, assembling, replacement and cleaning of plates and replacement of the gaskets, reinstalling and commissioning of the heat exchanger for unit 1 to unit 6. Work instructions during this period shall be provided by means of task order of which the value will be based on a bill of quantities price list as agreed upon by this contract.

1. INTRODUCTION

Duvha Power Station has six units and each unit consist of Boiler Auxiliary Colling system. The boiler auxiliary cooling system supplies de-mineralised water via a closed circuit system to the boiler and turbine plant to provide cooling for bearings, oil coolers, samplers, etc. The returning hot water is then cooled in two banks of heat exchangers deriving their cooling water from the main cold CW ducting in the turbine basement. The CW from the heat exchangers returns to the main hot CW ducting also in the turbine basement.

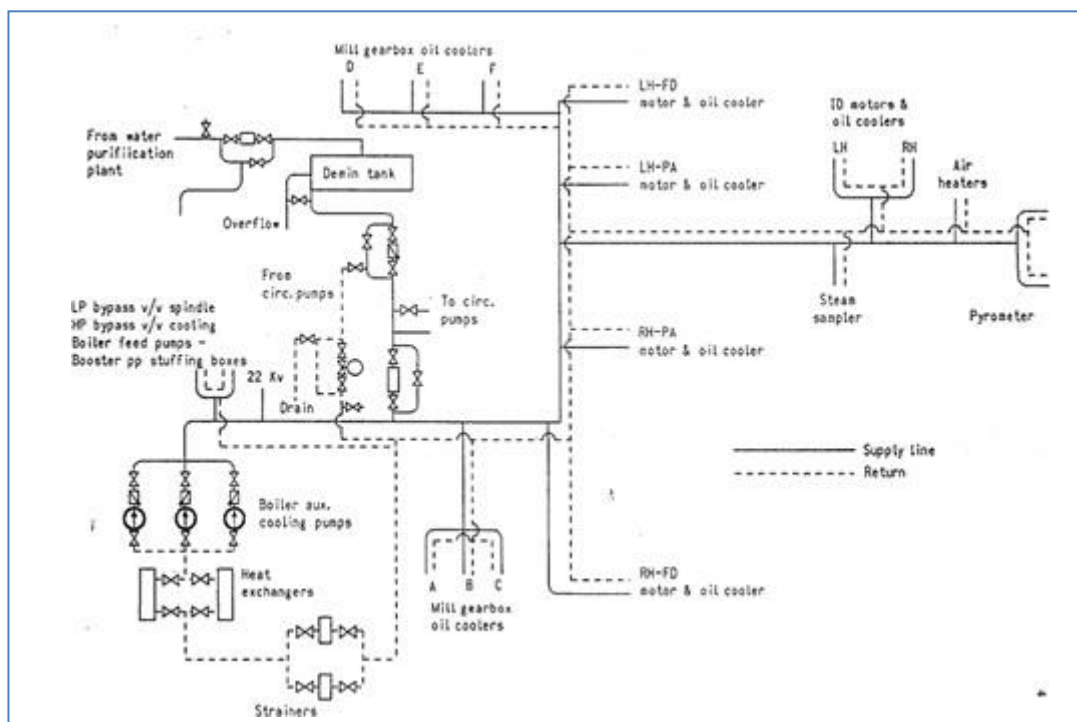

Figure 1: Boiler Auxiliary Cooling system

The heat exchangers that are installed in the BAC are plate type heat exchangers. Plate heat exchangers consists of a pack of corrugated metal plates with portholes for the passage of the two fluids between which heat transfer will take place.

System Engineer (SE): It is the role of the System Engineer to ensure that this scope is executed accordingly and ensure all the work is done as per specification.

Contractor: It is the role of the Contractor to conduct the works in accordance with the details provided in this document and adhere to all the terms in the contract.

3. SYSTEM DESCRIPTION

3.1 BACKGROUND

The BAC system has three major components which are the pumps, heat exchangers and the pipe network. Each unit has 3 pumps and 2 heat exchangers. Only one pump and one heat exchanger are required to be in service to achieve full load. The heat exchanger set has duplex strainers that can be removed for cleaning by bypassing it. One strainer will be bypassed and the other one will be in use. The boiler auxiliary valves can only be opened and inspected during major outages. Each unit has one demineralised water head tank that requires an outage for cleaning.

Table 1: The primary design of the system is as follows:

Piping	Mild steel and Stainless steel in the trenches	
Pumps	130l/s at a discharge head od 32.4m	
Heat exchanger	Process Side	Service Side
Inlet temp	46°C	32°C
Outlet temp	40°C	40°C

3.2 HEAT EXCHANGER SPECIFICATIONS

The heat exchangers that will be refurbished in the BAC will be plate type heat exchangers. Plate heat exchangers consists of a pack of corrugated metal plates with portholes for the passage of the two fluids between which heat transfer will take place. When a package of plates are pressed together, the holes at the corners form continuoustunnels or manifolds, leading the media (which participate in the heat transfer process)

CONTROLLED DISCLOSURE

from the inlets into the plate pack, where they are distributed in the narrow passages between the plates.

Figure 2: Plate Heat Exchanger

Because of the gasket arrangement on the plates, and the placing of “A” and “B” plates alternately, the two liquids enter alternate passages, e.g. the warm liquid between even number passages, and cold liquid between odd number passages. See figure 2.

Thus the media are separated by a thin metal wall. In most cases the liquids flow in opposite directions.

During the passage through the PHE, the warmer medium will give some of its heat energy to the thin wall, which instantly loses it again to the colder medium on the other side.

The warmer medium drops in temperature, while the colder one is heated up.

Finally, the media is led channels at the end of the plates and discharged from the heat exchanger. Table 2 below represent the plate heat exchanger specifications and Appendix A
